
Deployed model
Static gene features
Learned representation
Functional output weights
Original θ_0
GPT-6 Astra constructs an update program
Inspect model and task
Write update program
Reuse across feedback rounds
Compute parameter updates from feedback
Update program
Repeated execution with experimental feedback
Feedback pool
Measured feedback
Validate updates
Output weights (zoom)
Edited
Unchanged
Example parameter changes
Param
Before
After
w_0 +0.06247 → +0.04927
b_0 +0.01714 → +0.00517
Reloadable checkpoint
Targeted parameters updated
Other parameters unchanged
Save → native reload
Use updated predictions
WeightLoop
New measurements
Feedback accumulates across batches
Decide with $\theta_t = \theta_0 + \Delta_t$
Rank candidates
Select next batch
Next experimental batch
